

FORCEFIELD

magnetic filtration that removes wear metal

Removes the damaging small metal particles that flow right through your spin-on filter.

Only a thin film of oil cushions fast moving engine parts. But the oil you think is clean is actually full of tiny wear-metal particles causing ongoing damage.

These metal particles gouge, pit and score the machined surfaces and generate even more metal shavings in the process. Bearings, camshafts and pistons wear. Performance suffers and costly repairs may be needed.

UPGRADE TO DUAL PROTECTION

FORCEFIELD's powerful magnet removes all metal particles and allows your spin-on filter to remove the non-ferrous contaminants.

CLEAN OIL WORKS BEST

Even the best synthetic oil if dirty can cause damage. FORCEFIELD keeps oil working at its best between oil changes.

CONSTANTLY CLEANS ALL THE OIL

Because all the oil has to pass over the powerful magnet, all the oil is constantly cleaned as it circulates.
